RetailEdge 2024.07.1 Release Notes

Release Notes / Updates · https://retailedge.com/docs/retailedge-2024-07-1-release-notes

This is a minor release that adds a new program update mechanism and fixes some issues related to RetailEdge version 2024.7.0.

New Features

RetailEdge has a new update mechanism that simplifies program updates. Future program updates will **no longer require** users to start RetailEdge with Administrator privileges before starting the update process.

Fixes and Improvements

1. **Quick Table Check**: Fixed problem when Customer Display feature was turned off. The Quick Table Check utility will now correctly verify all tables.

2. **Program Update Announcement Form**: Fixed issue where program update messages were sometimes appearing on customer-facing display. RetailEdge would appear frozen because a modal window was on the customer facing display and not visually available to the RetailEdge user.

3. **Sales Screen**: Fixed problem with price-based, embedded, barcodes. Price and weight embedded barcodes should now work correctly on both the traditional and touch based sales screens.

4. **Sales Screen**: Fixed issue where inventory items with duplicate AddOn values were not getting added to the sales screen. RetailEdge will now load all AddOn items, even if they are duplicates (ex: 10 AddOn items of the same SKU will now be added 10 times to the Sales screen).

5. **Sales Screen**: Fixed issue where House Charge Distribution form would sometimes be displayed on the customer facing display and not be visually available to the RetailEdge user.

6. **Traditional Sales Screen**: Improved cursor focus and string selection when editing item descriptions. Item description is now fully selected instead of the cursor focus landing at the beginning of the description. A similar change was made to the Customer Search box.

7. **Sales Screen**: Made small change to improve accelerator keys on Touch-based Sales screen.

8. **Sales Receipts**: Layaway Payment History Report is now correctly showing on receipts.

9. **Edit Purchase Order**: Fixed problem with PO “Move Line(s)” function on purchase orders that have been partially received.

10. **Filter Selection Screen**: Restored the default action of the Enter/Return key. Pressing Enter after typing in filer text once again adds a new filter to the Current Filters list.

11. **Filter Selection Screen**: “Taxable” and “Matrix Parents” filters now work correctly.
